Aegis BMD BMC4I Spiral Evolution

PEO C4I BMD IPR

The diagram illustrates the Aegis Ballistic Missile Defense (BMD) architecture and the transition from wideband to narrowband tracking. Key components and processes shown include:

- SATCOM STADIL-J / JRE**: Satellite communication system providing **Cue from BMDS Sensor**.
- DSP, SBIRS, STSS**: Detection and tracking sensors in space.
- Object Classification**: Initial identification of the target.
- Wide Band/Medium Band Feature Extraction**: Initial tracking phase.
- Principal Track Reports**: Data generated during the wideband tracking phase.
- High Resolution Medium Band Tracking**: More detailed tracking phase.
- Transition to Narrowband Track**: The final, most precise tracking phase.
- Cued Search**: Search initiated based on intelligence or sensor cues.
- Narrowband Search**: Precise search within a specific area.
- Launch Area**: The region where the missile is launched.
- Aegis**: The missile defense ship that coordinates the defense.
- Track Thru Staging & Debris**: Monitoring the missile's path through its various stages.
- Aegis Track Reports to BMDS**: Data sent from the ship's radar to the Ballistic Missile Defense System.
- BMDS Acquisition**: The system's initial lock on the target.
- Launch on Aegis Engage on Aegis**: The command to launch an interceptor.
- Interceptor**: The missile launched to destroy the target.
- Radar**: Shipboard radar systems.
- BMDS**: The Ballistic Missile Defense System.
- C2BMC**: Command, Control, and Battle Management Computer.
- IR Discrimination**: Infrared sensor used for target discrimination.

UNCLASSIFIED

050404 / S-04-0248MAF-08

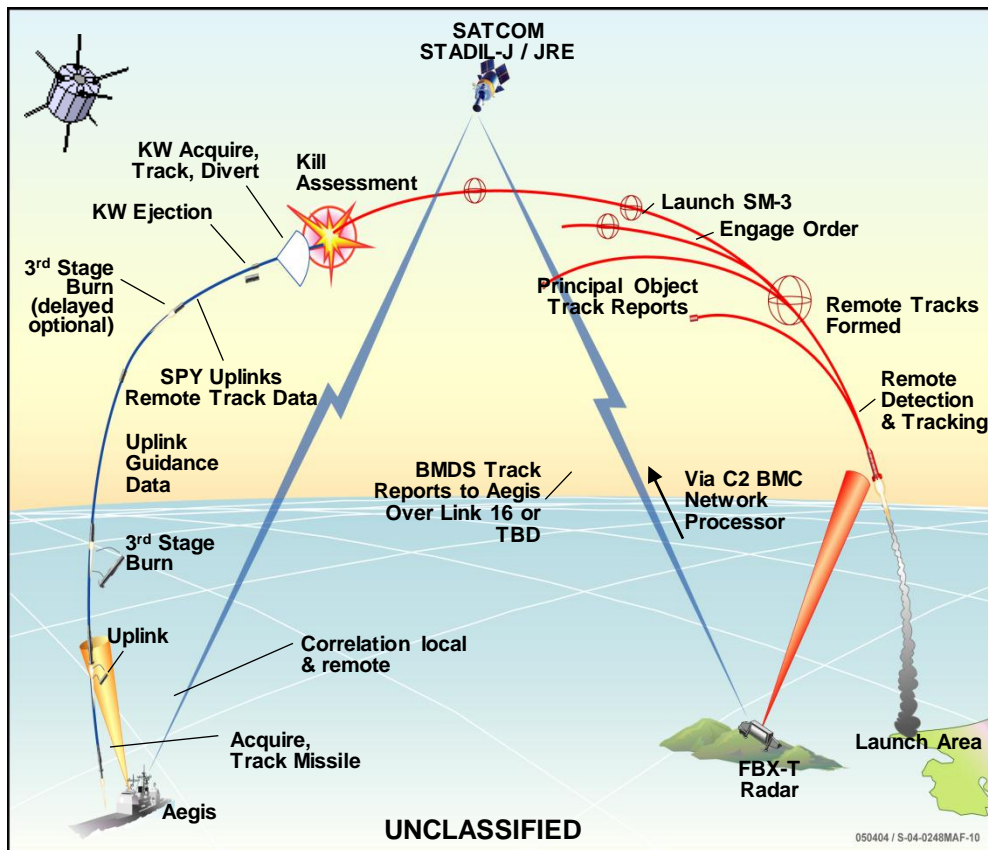

- (U) Forward ship conducts autonomous or directed mission plan for prescribed LAD
- (U) Forward ship conducts autonomous or cued search over LAD
- (U) Forward based Aegis detects and tracks ballistic missile in boost or ballistic phase and provides principal object track and classification data to BMDS via Link 16
 - (U) Once in track, forward ship computes position, velocity covariance and selected ID of threat track(s) as track reports
- (U) Forward ship transmits state and covariance data to other BMDS elements
- (U) BMDS sensor or weapon completes engagement sequence

Forward Based Aegis Provides Track State and Covariance Data to BMDS Elements

BMD 5.1 Engage On Remote (EOR)

PEO C4I BMD IPR

- Aegis ship conducts autonomous or directed mission plan for prescribed LAD
- Threat is launched and detected
- Forward ship or other BMDS sensor transmits state vector, and track quality (TQ) to firing ship
- Firing ship executes C&D processing to predict launch and impact points, and requests covariance data
- Engagement order is processed:
 - Prelaunch computes fire control solution and recommends time to fire missile
 - Based on EOR FOM
 - WCS sends missile initialization command to VLS
 - Missile is fired and acquired by SPY
 - Ship computes and uplinks 2nd stage midcourse guidance using remote data
 - Ship provides 3rd stage guidance support and handover to missile using remote data
 - Missile provides KW stage track, IR discrimination, eject, divert, and intercept
- Following intercept, firing ship conducts kill assessment for possible subsequent shot

Firing Ship Engages Threat Using Remote Track Data

Aegis BMD C4I Capability Evolution

PEO C4I BMD IPR

BMD 3.6.1

SRBM and MRBM Defense
Surveillance Support to BMDS

Long-Range Surveillance and Tracking
Operational Engagement Capability

SM-3: Block I, Block IA

Near Term Sea-Based Terminal
Launch on Remote

Planning Data Exchange - Manual (GCCS-M, ISNS)
OPIR Space Cues (JTT)
Missile Initialization (NAVSSI)
Increased Bandwidth (EHF, ADNS)
Increased Track Capacity (EHF, CDLMS)
Survivable/Protected Comms (EHF)
Network Redundancy (CDLMS)
BMDS Cross-AoR Connectivity (Ship/Shore)

BMD 4.0.1 and BMD 5.0

Enhanced SRBM, MRBM
& Limited IRBM Defense

Improved Capability against Complex Targets
– Object Classification and Discrimination
– Coordinated RF/IR Discrimination
– Threat Update Capability

Increased Battlespace with SM-3: Blk IA & Blk IB
– Improved Engagement Coordination
– Improved Launch on Remote

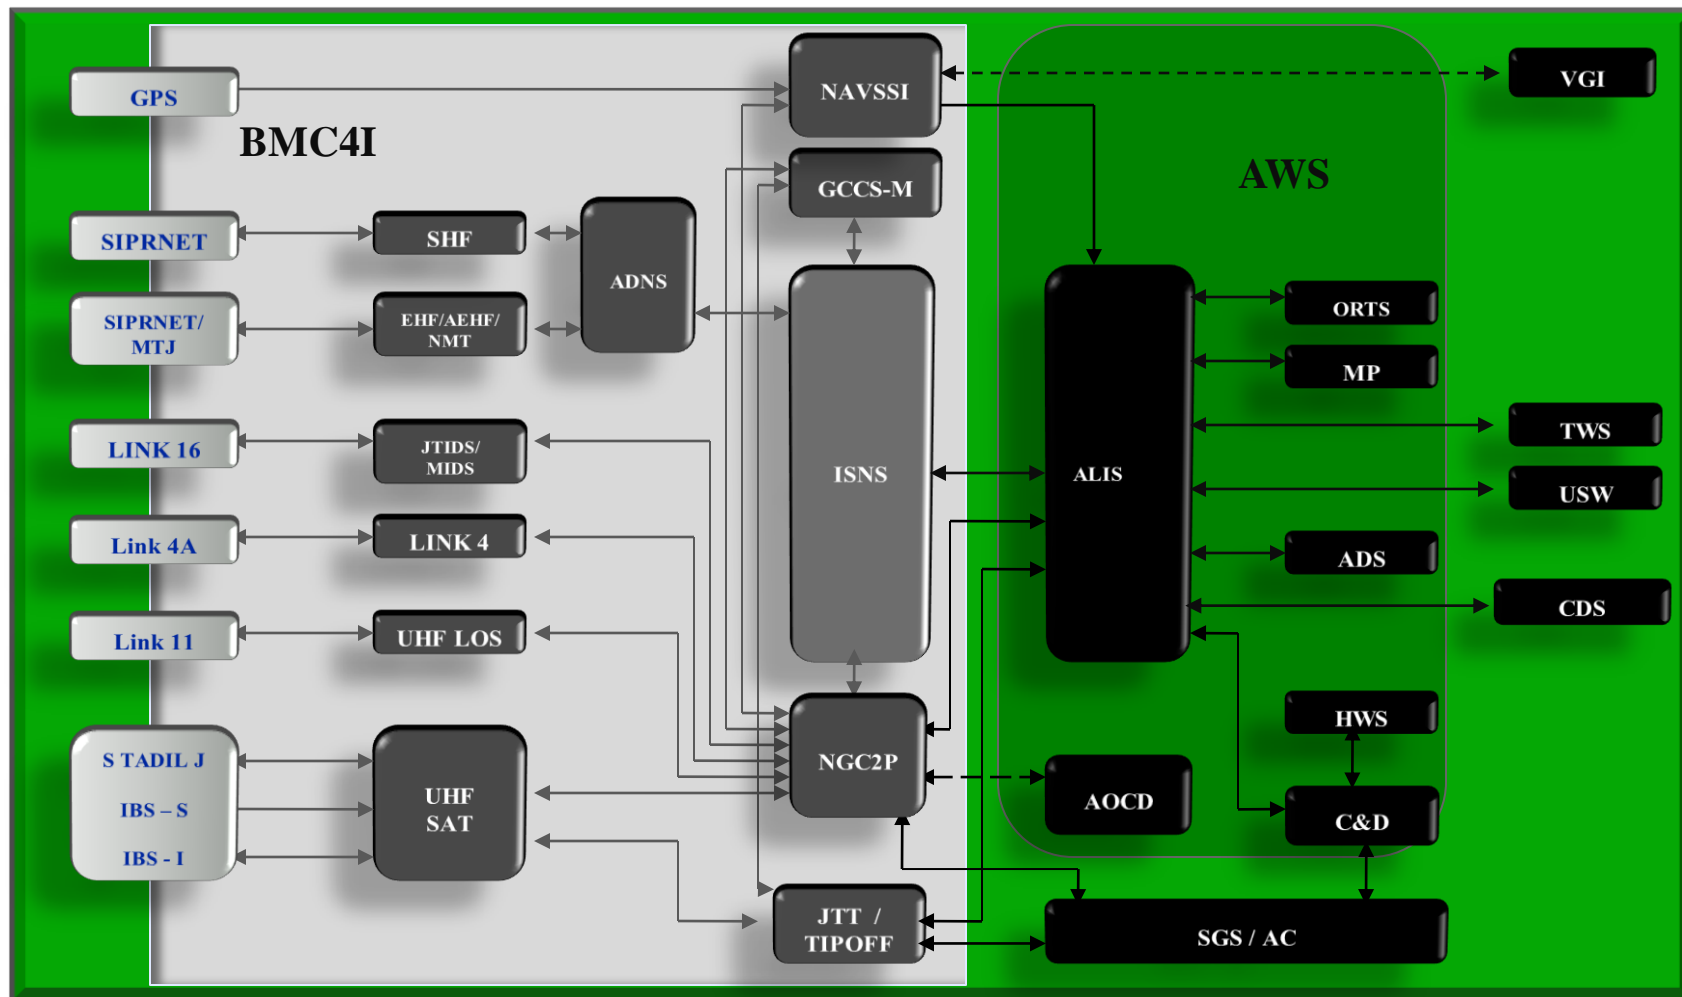

Planning Data Exchange - Automated (GCCS-M, ISNS)
Receipt of System Calibration Data (GCCS-M, ISNS)
OPIR Space Cues (JTT Updated Interface)
Launch on Remote (CDLMS)
Engagement Coordination (CDLMS)
War Diary (CDLMS)
Multiple-Path Deterministic Routing (ADNS)
Increased SATCOM Capacity (NMT, CBSP)
Cross-AoR Redundancy (Ship/Shore)

C4I to AWS Interface

Aegis BMD 5.0 / B/L9 (ACB12)

PEO C4I BMD IPR

“Mission Critical” for C4I Systems (1 of 2)

PEO C4I BMD IPR

Mission Critical Requirement	*TLR	**ECS	Notes
<i>Probability of Communications Support (Pcs)</i>	X		The Pcs value (classified) is included within the performance allocations for LRS&T and LoT (under Pssek)
• C4I Reliability	X		The C4I reliability value (classified) is derived from the Pcs Analysis (uses PEO C4I ORD specifications)
• Redundancy of Communication Paths	X		TLR specifies multiple communications paths (and priority): EHF MTJ, SHF MTJ (MIL), SHF MTJ (COM), UHF STJ
• Automated Failover / Recovery	X		TLR specifies automated failover in priority order, and also recovery over the highest priority path available
• No Single Points of Failure			Part of design trade space, to be assessed against reliability requirement
• Redundant Power Supply			Part of design trade space, to be assessed against reliability requirement
<i>Reliability, Maintainability, and Availability (RMA)</i>			RMA specifications are defined for the combat system, however they are not allocated/flowed to C4I systems. Reliability for C4I systems is covered as a component of Pcs.
• MTBCPMCE		X	Mean Time Between Computer Program Mission Critical Events
• MTBEMCE		X	Mean Time Between Equipment Mission Critical Events
• Ao		X	Inherent Availability
• MTTR		X	Mean Time to Repair
• MTBCPMCE		X	Mean Time Between Computer Program Equipment Failures

***C4I Requirement Specified within the PEO C4I BMD Top Level Requirements (TLR)**

****System Requirement Specified within the Aegis BMD Element Capability Specification (ECS)**

“Mission Critical” for C4I Systems (2 of 2)

PEO C4I BMD IPR

Mission Critical Requirement	*TLR	**ECS	Notes
<i>Environment / Survivability</i>			
• Grade A Shock		X	Per MIL-STD-901D
• Environmental Vibration		X	Per MIL-STD-167-1A
• EMI / Lightning		X	Per MIL-STD-464
• Rain		X	Per MIL-HDBK-310
• Sea State		X	
• HAENS			BMDS-Level Requirement (MDA Core Standard)
• Transmission Security		X	TRANSEC(anti-jam, frequency hopping)
• Temperature Extremes		X	MIL-STD-210
• Electromagnetic Compatibility		X	EMC, per MIL-STD-461
• RF Transmissions		X	ITU-RP834-3, ITU-RP676-5
<i>Other</i>			
• MAC Layer I, IA Controls		X	Per DoD 8500.2, also DIACAP, IATF
• Physical Security		X	Per DoD 5200.8R
• System Safety		X	Per MIL-STD-882, Aegis BMD ISSMP

***C4I Requirement Specified within the PEO C4I BMD Top Level Requirements (TLR)**

****System Requirement Specified within the Aegis BMD Element Capability Specification (ECS)**
